

REMARKS

Reconsideration is requested.

Claim 42 has been canceled, without prejudice. Claims 41 and 43-93 are pending. Claim 41 has been revised, without prejudice, to include the details of claim 42. Claims 52-93 have been withdrawn from consideration.

The Section 112, first paragraph "enablement", rejection of claims 41-51 is traversed. Reconsideration and withdrawal of the rejection are requested in view of the following comments and the attached extract from Websters online dictionary. The Examiner is requested to consider the attached and acknowledge same pursuant to MPEP § 609.05(c).

The Examiner asserts that the term "prophylaxis" means that the agent will necessarily completely prevent PCD in every patient that receives the treatment at any point following the administration of the prophylactic agent and, in accordance with this interpretation of "prophylaxis", the specification was allegedly not considered to provide reasonable enablement for the "prophylaxis" of a protein conformational disorder.

However, one of ordinary skill in the art (e.g. a medical practitioner) will be able to practice the claimed invention without undue experimentation. The Examiner has not provided any evidence to the contrary. The Examiner has not provided any evidence to support the Examiner's interpretation of the objected-to term.

Claim 41 refers to "prophylactic treatment". Persons of ordinary skill in the art, such as medical practitioners, would understand the term "prophylactic treatment" to

mean any treatment administered before the onset of a disease which delays the onset of the disease or reduces its severity after onset.

This meaning is confirmed by the Webster's Online Dictionary 2009 (extract attached) which defines prophylactic as:

Preventing or contributing to the prevention of disease;
[emphasis added]

The term "prophylactic treatment" does not imply complete prevention in all patients and this is how the ordinarily skilled person would interpret this term, in the same way that the ordinarily skilled person would not regard a "therapeutic treatment" as necessarily providing a complete cure for all patients.

The data in the specification shows that the stimulation of autophagy in mice engineered to develop HD from 4 weeks onwards has the effect of delaying the onset of HD and reducing the severity of its symptoms. This demonstrates that mutant huntingtin is cleared through the autophagy pathway before it can aggregate and exert a cytotoxic effect. The administration of an autophagy inducer such as CCI-776 to an individual therefore exerts a prophylactic effect which may be useful in delaying the onset of a protein conformational disorder.

On the basis of the teaching of the specification, the skilled person would be able to employ the claimed methods to provide a prophylactic treatment of a protein conformational disorder.

Claims 41 to 51 are supported by an enabling disclosure and withdrawal of the Section 112, first paragraph "enablement", rejection is requested.

The Section 112, second paragraph, rejection of the claims 41-51 is obviated by the above amendments. The claims have been revised, without prejudice, to advance prosecution. Withdrawal of the Section 112, second paragraph, rejection of claims 41-51 is requested.

The Section 102 rejection of claims 41-51 over Ravikumar, "Aggregate-prone proteins with polyglutamine and polyalanine expansions are degraded by autophagy" which published in Human Molecular Genetics, 2002, Vol. 11, No. 9, 1107-1117, is obviated by the attached Declaration. Withdrawal of the rejection is requested.

The Section 102 rejection of claims 41-47 and 49-51 over Lin (EP 0778023) is traversed. Reconsideration and withdrawal of the rejection are requested in view of the following distinguishing remarks.

Lin et al describes the use of rapamycin and rapamycin analogues as neuroprotective agents which protect neuronal cells from glutamate toxicity in vitro and may therefore be useful in the treatment of

"stroke, head trauma and neurodegenerative disorders, such as Alzheimer's Disease, amyotrophic lateral sclerosis (ALS), epilepsy, Huntington's Disease or Parkinson's Disease".

Intracellular protein aggregates are associated with toxicity and cell death in protein conformational disorders. The present specification shows that stimulation of autophagy leads to the clearance of the proteins whose aggregation causes intracellular toxicity. This clearance has a prophylactic effect and stimulation of autophagy in an individual before the onset of a protein conformational disorder delays the onset of the symptoms of the disorder and reduces their severity, when they do develop.

The experimental data in the specification confirms the prophylactic effect of autophagy stimulation in a murine HD model (see figures 21 to 24). Treatment of mice at 4 weeks with the autophagy inducer CCI-779 delays the subsequent onset of HD symptoms and reduces their severity relative to untreated mice. The data shows that autophagy stimulation is useful in preventing the build-up of protein aggregates within cells before the onset of symptoms of the protein conformational disorder.

By contrast, Lin et al describes the survival of isolated hippocampal cell cultures exposed to glutamate. Insofar as these *in vitro* results can be extrapolated to any *in vivo* situation at all, they can only be extrapolated to the treatment of cells with the therapeutic agent after an insult has occurred. They do not teach any protective effect which is induced before the insult has occurred and cannot therefore be extrapolated to prophylactic therapies.

Lin et al therefore contains no teaching of the prophylactic use of rapamycin macrolides in asymptomatic individuals to delay the onset of symptoms of a protein conformational disorder and reduce their subsequent severity.

Withdrawal of the Section 102 rejection of the claims over Lin is requested.

The Section 103 rejection of claim 48 over Lin "in view of the applicant's own admission" is traversed. Reconsideration and withdrawal of the rejection are requested as Lin et al contains no teaching or suggestion regarding any prophylactic effect of rapamycin macrolides on protein conformational disorders and one of ordinary skill in the art would not have been motivated by the cited art to have employed rapamycin macrolides prophylactically in asymptomatic individuals.

RUBINSZTEIN et al.
Appl. No. 10/553,262
Atty Ref.: 620-394
Amendment
Monday, November 23, 2009

Withdrawal of the Section 103 rejection is requested.

The claims are submitted to be in condition for allowance and a Notice to that effect is requested. The Examiner is requested to contact the undersigned, preferably by telephone, in the event anything further is required.

Respectfully submitted,

NIXON & VANDERHYE P.C.

Prophylactic

Definition: Prophylactic

Prophylactic

Adjective

1. Capable of preventing conception or impregnation; "contraceptive devices and medications".
2. Tending to ward off; "the swastika...a very ancient prophylactic symbol occurring among all peoples"- Victor Schultze.
3. Preventing or contributing to the prevention of disease, "preventive medicine"; "vaccines are prophylactic"; "a prophylactic drug".

Noun

1. Remedy that prevents or slows the course of an illness or disease; "the doctor recommended several preventatives".
2. Contraceptive device consisting of a thin rubber or latex sheath worn over the penis during intercourse.
